Patient Address: 3601 Piedmont Rd Ne Atlanta GA 30305
DOS: March 24, 2023

The patient was seen today for fitting of spinal orthosis per their treatment plan for the lumbar region dysfunction as diagnosed during their evaluation.
Upon patient evaluation the prescribed orthosis will need to be customized and fitted to the patient beyond the basic minimal self-adjustment.
Orthosis does not adequately fit patient as manufactured. LSO requires modification due to the individual patient's lumbosacral anatomy, abdominal shape and waist and hip measurements without pressure points or other issues

Spinal Measurements
Lumbar Measurements
Lower Rib (in): 46
Waist (in):45
Hips (in):51

Lumbar Prefabricated Brace Custom Fit Record
To accommodate the three anatomical measurements lumbar orthosis was adjusted for proper length and effective front closure overlap. Front closure was placed in a neutral position to accommodate neutral waist to hip contour. Heat molding was required for optimal support and motion restriction. The lumbar orthosis was disassembled to access the posterior panel. The posterior panel was heat molded to support and stabilize the patient's lumbosacral curve. In addition, inferior border of the posterior panel was heat molded to flare away from soft tissue when seated. The orthosis was checked for proper fit in both seated and standing positions. All questions and concerns have been addressed. The patient tolerated the fitting and does not report areas of discomfort. Patient has been educated on proper wear schedule, cleaning and use of the orthosis. Patient will return as required for further instructions or adjustments to the orthosis.
